Agenda Outline

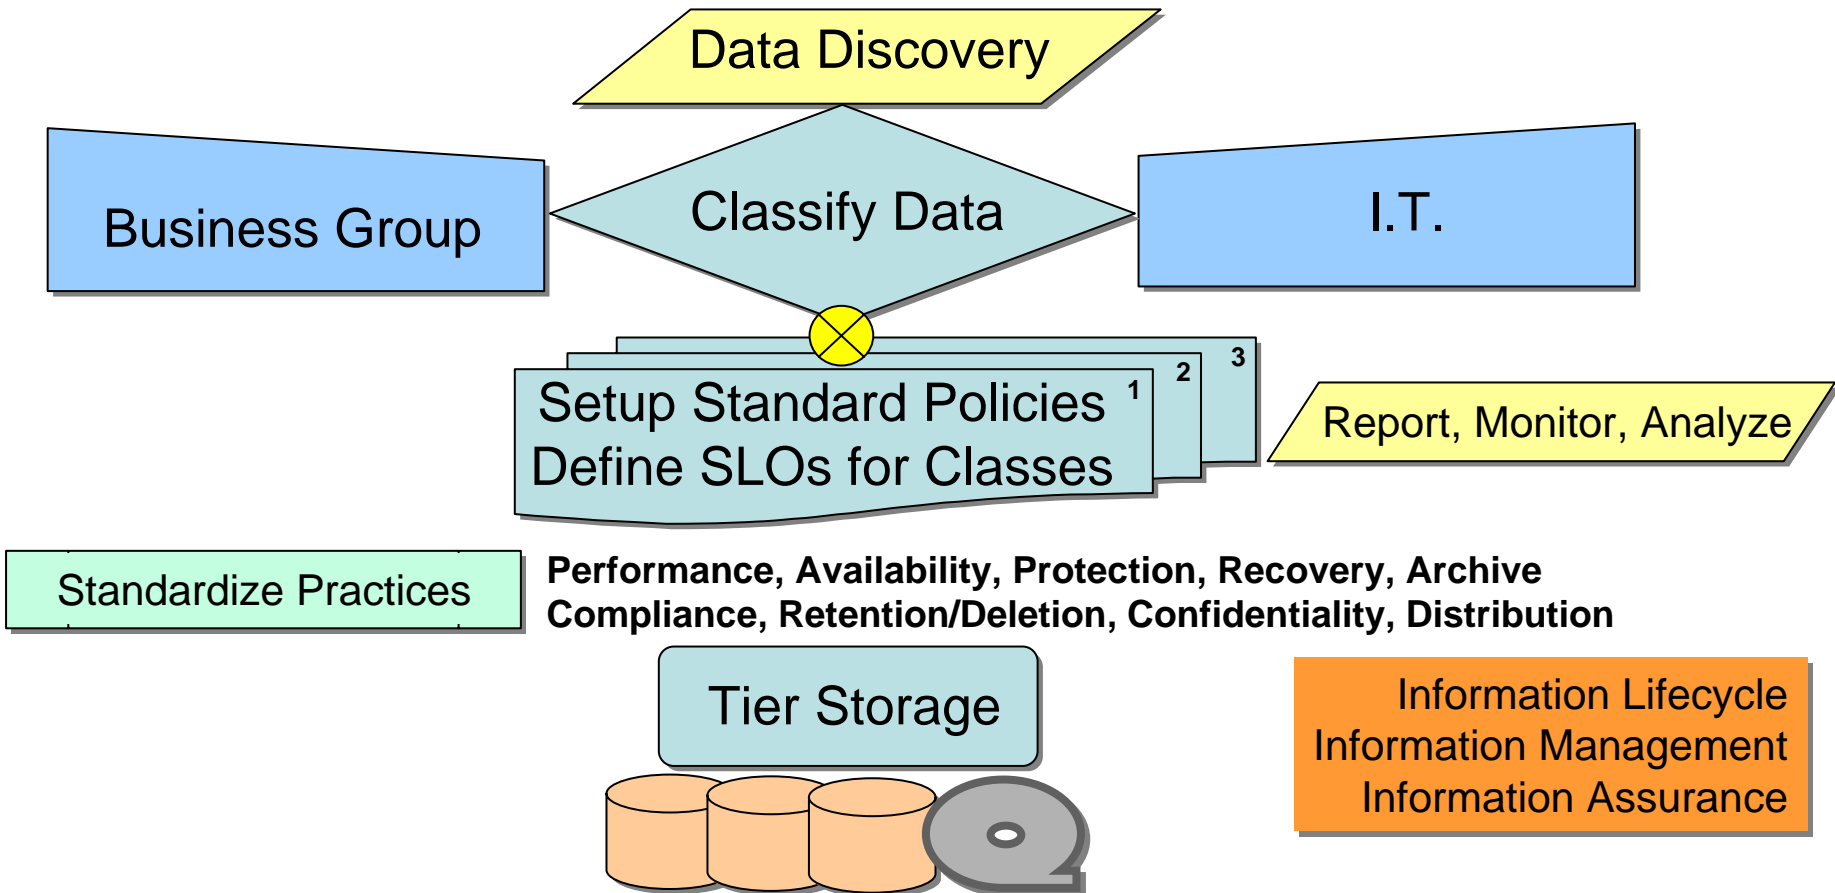

During this presentation we will cover:

- ✓ ILM Overview
 - ✓ Data Classification
 - ✓ SLOs & Policies
 - ✓ Tiered Storage
 - ✓ Q&A
-
- ✓ **Discussion**

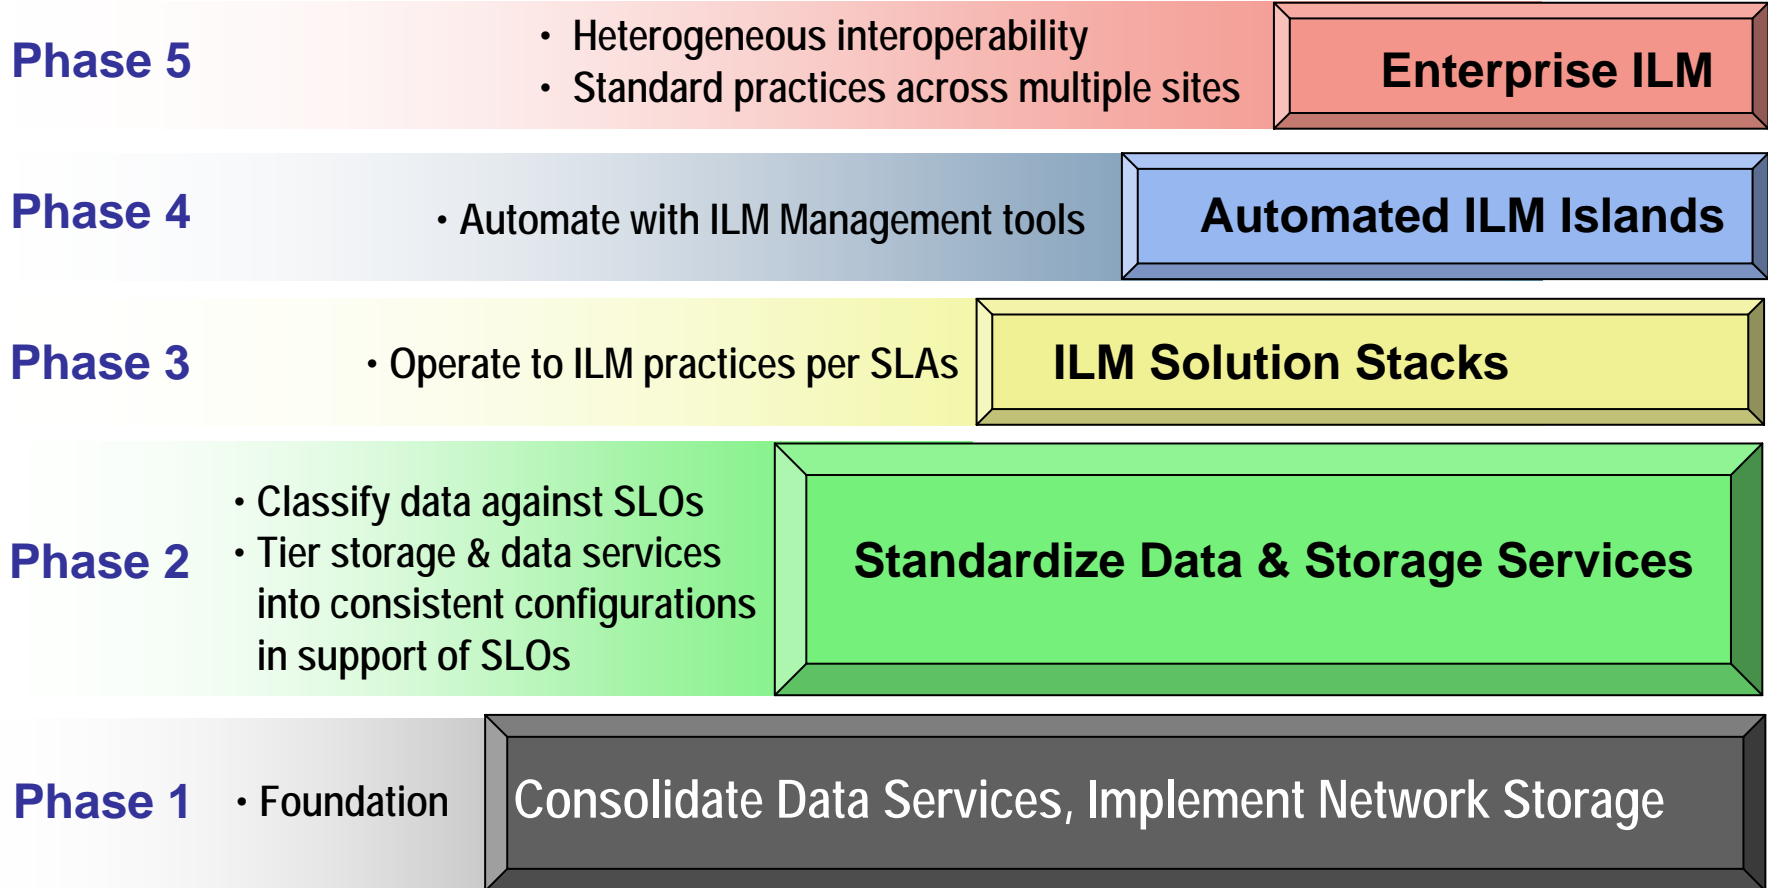

Implementing ILM

ILM is a standards-based, business-driven management practice

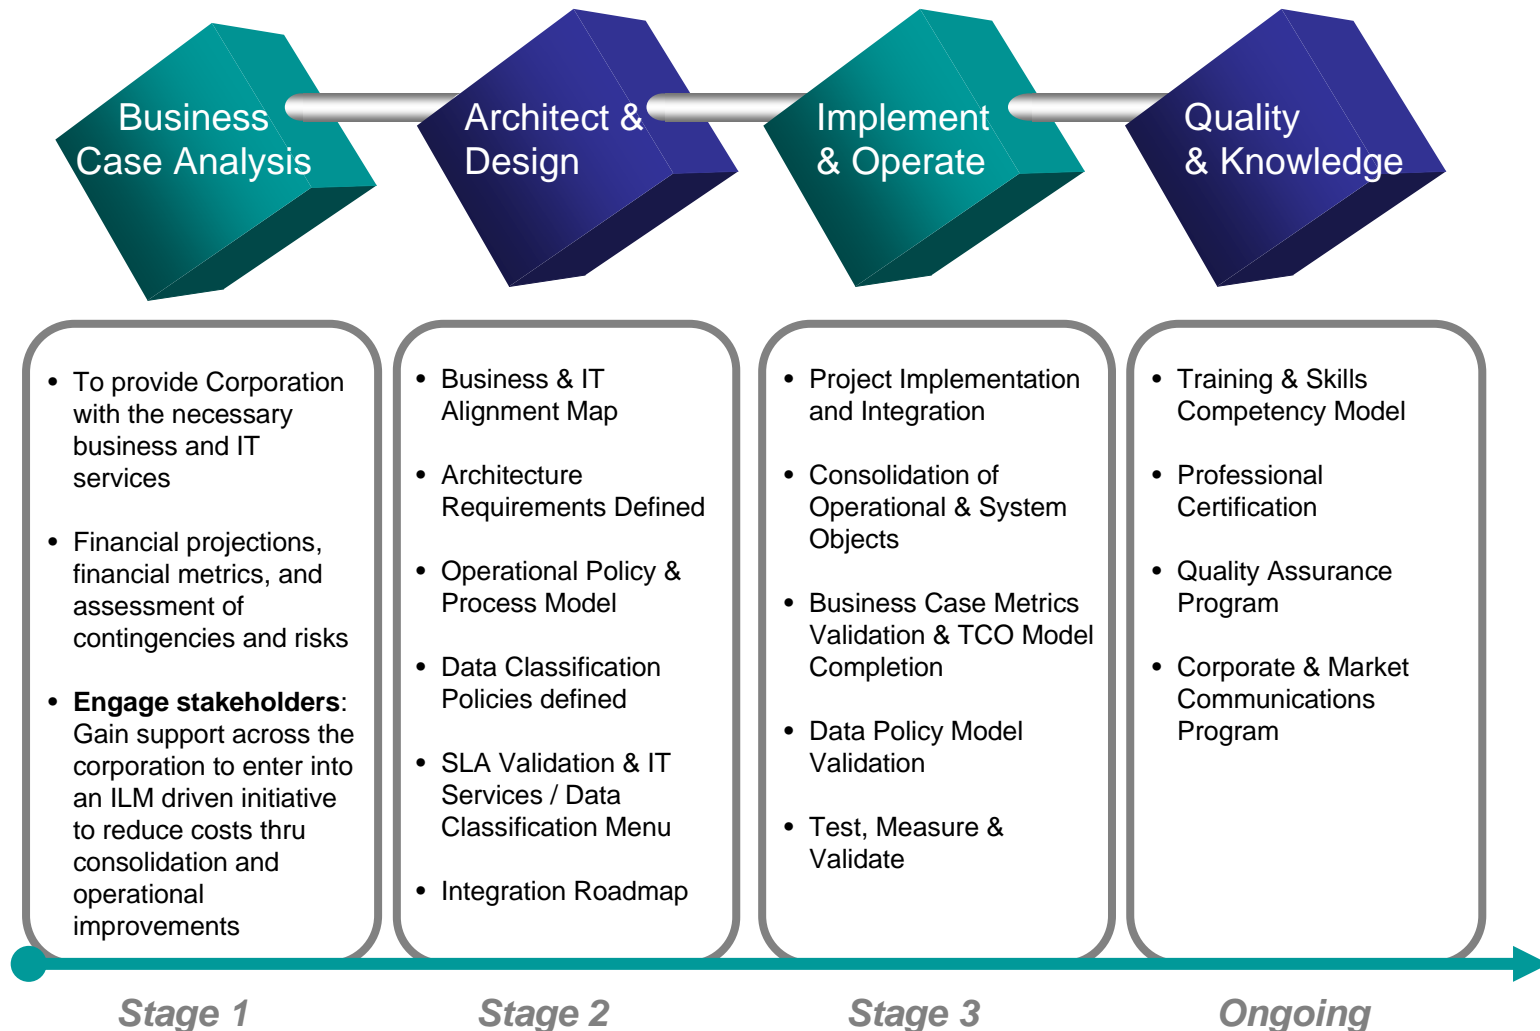

ILM Roadmap

Time 

A Process-based Approach

What is Data Classification?

- ✓ **Organization of data and information into groups for management purposes.**
 - ✓ Allows IT to create multiple service level offerings
 - ✓ Allows LOB to select services based on value of data
 - ✓ May use software to enable some of the process
- ✓ **Represent corporate requirements:**
 - ✓ Security officer: Secret, confidential, proprietary, ...
 - ✓ Records Manager: retention time, ...
 - ✓ Compliance officer (HIPAA, SOX, ...): authorization, retention, ...
- ✓ **Represent LOB requirements:**
 - ✓ Application performance, availability, recoverability, ...
 - ✓ Staff response time, asset reporting, ...
- ✓ **IT Organization needs data classification:**
 - ✓ Method to rationalize requirements into service level offerings

How is Data Classified?

Data Classification, Policies, SLOs are tightly coupled

❏ **Classify by application**

- ❏ All data from a specific App assigned same classification
- ❏ Simple; good start; a first approximation

❏ **Classify by groups of data**

- ❏ Production or Process data
- ❏ LOB, Department, Owner, Customer, ...
- ❏ Compliance requirements by regulation type

❏ **Classify by metadata**

- ❏ Time last accessed, date created, type of data, author, etc

❏ **Classify by content**

- ❏ Content-filtering for compliance, grouping, risk classification
- ❏ Security and Data classes can merge

Classification allows Classes of Service

✓ Define Service Level Objective framework

- Class of infrastructure for performance & resiliency
- Availability requirements (99.xxx%)
- Data Protection & Recovery classes (RTO-RPO mins to days)
- Archival classes (online, tape, off-site, ...)
- Compliance classes (HIPAA, SOX, ...)
- Confidentiality (in the host, in the network, on storage, at rest...)
- Others ...

✓ Focus on what level of service is required for data

- Not on how it is delivered
- Technology changes, service levels don't

✓ Only create SLOs that are important to your business

Sample Class Models

Security Classes:

- CLASS-1 Public Information, CLASS-2 Internal Information, CLASS-3 Confidential Information, CLASS-4 Secret Information, CLASS-5 Hazardous Information

Source: U.S. Gov, ISO 17799

Processor Model

Tier Description
Tier 1 – Mission Critical
Tier 2 – Business Critical
Tier 3 – Business Important
Tier 4 – Productivity Important
Tier 5 – Non-Critical

Source: IBM Mainframe – circa 1990

DMF Work in Progress

DATA CLASSIFICATION MODEL

- Class 1 – Not Important to operations
- Class 2 – Important for Productivity
- Class 3 – Business Important information
- Class 4 – Business Vital information
- Class 5 – Mission Critical information

Acme Data Classification Menu

	Mission Critical	Business Important
Requirement	SLO Group	SLO Group
Performance	High Throughput	Medium throughput
Availability	99.999%	99%
Operational Recovery -RTO	<15 minutes	<2 hours
-RPO	<5 minutes	<8 hours
Disaster Recovery -RTO	<4 hrs	<1 week
-RPO	<5 minutes	<8 hours
Compliance (Retention)	30 yrs	7 yrs
Confidentiality	Class 4 – Secret	Class 3 - Confidential
Archive Inactive Data	120 days	180 days
Charge-back	\$\$\$\$	\$\$

With Data Classification: Standard Configurations

Simplified Management, more efficient, scalable

The Operational Recovery Spectrum

WHAT IS TIERED STORAGE?

- ❖ **Tiering means establishing a hierarchy of storage systems based on service requirements (performance, business continuity, security, protection, retention, compliance, etc.) and cost.**
- ❖ **Tiering storage requires some mechanism to place data:**
 - ❖ Static – applications assigned to specific tiers
 - ❖ Staged – batched data movement (e.g. archive)
 - ❖ Dynamic – some active data mover (e.g. HSM or ILM policy services)

How Much Inactive Data do you Have?

Old definition: Inactive Data - **Not being accessed within 30 days**

Improperly Classified Data Is Very Expensive

- What is today's definition of inactive data?
 - Reference:** Data that will not be modified for the remainder of its lifetime, but still needs regular access.
 - Inactive:** Data that will not be modified and is accessed very infrequently. Typically retained for regulatory or auditing reasons.

- “Access frequency” does not define value or future need for access anymore?
 - Beware: However you measure it, leaving inactive or reference data on Primary-Storage is increasingly costly and inefficient
 - Lesson: Be sure you are classifying and measuring it correctly – then tier your storage

I.T's perceived mix of what they really have online

ILM Roadmap

Time 

In the end: Satisfy the LOB & Make the company successful

Value of ILM to IT

<i>Help LOB to...</i>		<i>Illustrative</i>				
		<u>Low</u>	*	<u>Med</u>	*	<u>High</u>
Decrease Costs	LOB Importance	Grey	Grey	Grey	White	White
	Our Ability to Deliver	Teal	Teal	Teal	Teal	Teal
Improve Productivity	LOB Importance	Grey	Grey	Grey	Grey	Grey
	Our Ability to Deliver	Teal	Teal	Teal	Teal	Teal
Increase Revenues	LOB Importance	Grey	Grey	Grey	Grey	White
	Our Ability to Deliver	Teal	Teal	Teal	White	White
Happier I.T. Customers	LOB Importance	Grey	Grey	Grey	Grey	Grey
	Our Ability to Deliver	Teal	Teal	Teal	Teal	White
Improve Flexibility	LOB Importance	Grey	Grey	Grey	Grey	White
	Our Ability to Deliver	Teal	Teal	Teal	Teal	Teal
